AIM: Implementation of unification and resolution to real world application.

(1) Implementation of unification (Pattern Matching)

PROBLEM FORMULATION:

To find a mapping between two expression that may both contain variables. find the variables to their values in the given expression until no bound variable remain.

Initial state:

expr 1 = 'f(x, h(x), Y, g(Y))'

expr 2 = 'g(g(z), w, z, x)'

final state:

x = g(z)

w = h(x)

Y = z

expr 1 = f(g(z), h(g(z)), z, g(z))

expr 2 = f(g(z), h(g(z)), z, g(z)).

PROBLEM SOLVING:

- unify f(x, h(x), Y, g(Y)) & f(g(z), w, z, x).
- It would loop through each argument.
- unify (x, g(z)) is invoked.
  - x is a variable, therefore substitute x = g(z).
- unify (h(x), w) is invoked.
  - w = h(x).
- substitutions are mapped to a python dict. It is expanded as {Y: g(z), w: h(x)}
- unify (Y, z) is invoked
  - added directly to the dict.

$\{x = g(z),\ w = h(x),\ y = z\}$ # z - y or y - z is equivalent

→ unify (g(y), x) is invoked.

↳ x is a variable but is already present in the dictonary.

∴ the unify would be on the substituted value if it is not a variable i.e. if the substituted value is not a variable unify (g(y), g(z)).

↳ both the terms have g.

→ unify y & z.

all variables are bounded, unification is completed successfully.

Final result is $\{x = g(z),\ w = h(x),\ y = z\}$.

LAB 7

UNIFICATION AND RESOLUTION

Algorithm:
Step-1: Start
Step-2: Declare a Python dict mapping variable names to terms
Step-3: When either side is a variable, it calls unify_variable.
Step-4: Otherwise, if both sides are function applications, it ensures they apply the same
function (otherwise there's no match) and then unifies their arguments one by one, carefully
carrying the updated substitution throughout the process.
Step-5: If v is bound in the substitution, we try to unify its definition with x to guarantee consistency throughout the unification process (and vice versa when x is a variable).
Step-6: occurs_check, is to guarantee that we don't have self-referential variable bindings
like X=f(X) that would lead to potentially infinite unifiers.
Step-7: Stop

Unification:

```
def get_index_comma(string):
    index_list = list()
    par_count = 0

    for i in range(len(string)):
        if string[i] == ',' and par_count == 0:
            index_list.append(i)
        elif string[i] == '(':
            par_count += 1
        elif string[i] == ')':
            par_count -= 1

    return index_list
```

```

        predicate_symbol_2, arg_list_2 = process_expression(expr2)

        # Step 2
        if predicate_symbol_1 != predicate_symbol_2:
            return False
        # Step 3
        elif len(arg_list_1) != len(arg_list_2):
            return False
        else:
            # Step 4: Create substitution list
            sub_list = list()

            # Step 5:
            for i in range(len(arg_list_1)):
                tmp = unify(arg_list_1[i], arg_list_2[i])

                if not tmp:
                    return False
                elif tmp == 'Null':
                    pass
                else:
                    if type(tmp) == list:
                        for j in tmp:
                            sub_list.append(j)
                    else:
                        sub_list.append(tmp)

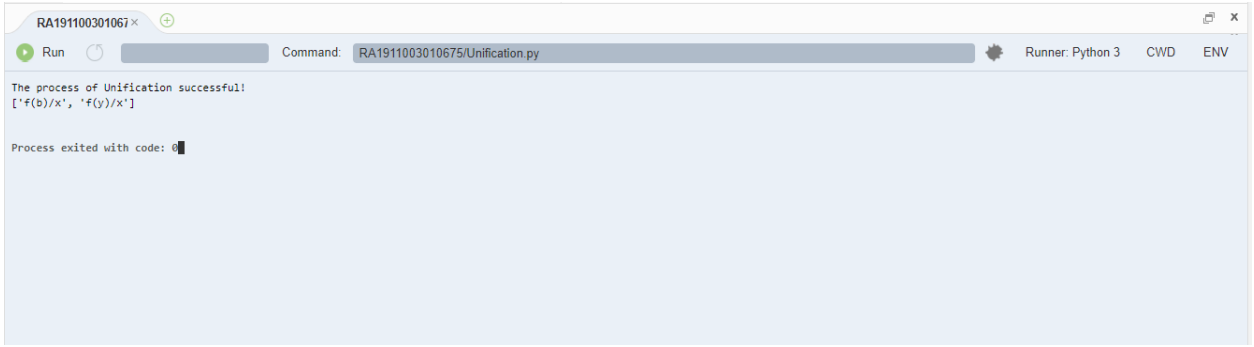
            # Step 6
            return sub_list

if __name__ == '__main__':

    #f1 = 'Q(a, g(x, a), f(y))'
    #f2 = 'Q(a, g(f(b), a), x)'
    f1 = 'Q(a, g(f(x), y), f(y))'
    f2 = 'Q(a, g(f(b), c), c)'

    result = unify(f1, f2)
```

```
    if not result:
        print('The process of Unification failed!')
    else:
        print('The process of Unification successful!')
        print(result)
```



Algorithm:
Step-1: Start
Step-2: if L1 or L2 is an atom part of same thing do
(a) if L1 or L2 are identical then return NIL
(b) else if L1 is a variable then do
(i) if L1 occurs in L2 then return F else return (L2/L1)
else if L2 is a variable then do
(i) if L2 occurs in L1 then return F else return (L1/L2)
else return F.
Step-3: If length (L!) is not equal to length (L2) then return F.
Step-4: Set SUBST to NIL
(at the end of this procedure , SUBST will contain all the substitutions used to unify L1 and L2).
Step-5: For I = 1 to number of elements in L1 do
i) call UNIFY with the i th element of L1 and I'th element of L2, putting the result in S
ii) if S = F then return F
iii) if S is not equal to NIL then do
(A) apply S to the remainder of both L1 and L2
(B) SUBST := APPEND (S, SUBST) return SUBST.
Step-6: Stop.

#) Implementation of Resolution (Predicate Logic).

PROBLEM FORMULATION:

By building reputation proofs i.e. proofs by contradictions prove a conclusion of those given statements based on the conjunctive normal form or casual form.

Initial State:

- John likes all kind of food.
- apple and vegetable are food.
- anything anyone eats & not get killed is food.
- anil eats peanuts & still alive.
- Harry eats everything that anil eats.

Final State
'TRUE'
(proved)

Prove the resolution: John likes peanuts.

PROBLEM SOLVING:

- conversion of facts into first order logic.
- $\forall x$: food(x) $\rightarrow$ likes (John, x)
- food (apple) $\wedge$ food (vegetable)
- $\forall x \forall y$: eats (x, y) $\wedge \neg$ killed (x) $\rightarrow$ food (y)
- eats (anil, peanuts) $\wedge$ alive (anil).
- $\forall x$: eats (anil, x) $\rightarrow$ eats (harry, x).
- $\forall x$: $\neg$ killed (x) $\rightarrow$ alive (x).
- $\forall x$: alive (x) $\rightarrow \neg$ killed (x).
- likes (John, peanuts).

Elimination of implication, moving negation inwards and renaming variables.

- $\forall x \neg food(x) \vee likes(John, x)$.
- food (Apple) $\wedge$ food (vegetables)
  - $\forall y \forall z \neg eats(y, z) \vee killed(y) \vee food(z)$.
  - eats (Anil, Peanuts) $\wedge$ alive (anil).
  - $\forall w \neg eats(anil, w) \vee eats(Harry, w)$
  - $\forall g \neg killed(g) \vee alive(g)$
  - $\forall k \neg alive(k) \vee killed(k)$.
  - likes (John, Peanuts).

Drop existential quantifiers.

- food (x) V likes (John, x).
- food (apple).
- food (vegetable).
- $\neg eats(y, z) \vee killed(y) \vee food(z)$
  - eats (Anil, peanuts).
  - alive (Anil).
  - $\neg eats(Anil, w) \vee eats(Harry, w)$
  - killed (g) V alive (g)
  - $\neg alive(k) \vee \neg killed(k)$
  - likes (John, Peanuts).

negate the statement to be proved

$\neg likes(John, peanuts)$.
